Waterbody: Hueneme Drain (tributary to Pacific Ocean)
Location: Pump Station 300 yds. downstream Surfside Dr. (34°8'26.91"N, 119°11'17.58"W)
Pros: Grass-covered sides fairly stable
Cons: Lots of activity nearby, high potential for vandalism, stagnant water
Outstanding Site Selection Tasks: Verify positive flow
Other Potential Sites: At Surfside Rd. at lower end of Bubbling Springs Park
Dry Season Flow Potential: Likely year-round flow due to urban runoff and groundwater contribution

Hydrology Section
MEMORANDUM

DATE: September 4, 2009 Updated August 12, 2010

TO: Tommy Liddell

VIA: Bruce Rindahl

FROM: Mark Bandurraga

SUBJECT: **NPDES Monitoring Site Yield Evaluation**

Per your request, we have used the land use and watershed information you provided to prepare a spreadsheet that can be used to estimate the runoff quantities from storm forecasts. The runoff quantity is estimated using the NRCS Curve Number approach that is a common method in hydrology. The results show that the weighed Curve Numbers estimated from the evaluation range from a low of about 74 for the rural Fox Canyon Drain watershed in Ojai to a high of about 91 for the urbanized watershed in the City of Ventura. The methodology and files used to calculate the Curve Numbers are described in this memo for the watersheds shown in Figures 1-4.

In August 2010 you requested results for another 7 monitoring sites across the county. This memo describes the additional work done for that request.

Curve Number Calculation Methodology

Land Use Data

Land Use data used in the study were provided by the Water Quality Section already clipped to the monitoring site boundaries and in a geodatabase. The land use data were extracted from the Assessor's Parcel database which is considered to be current as of the date of extraction (Feb 12, 2009). The various classifications in the file based on the assessor's 4-digit site use codes were sorted and assigned hydrologic land use names associated with the various classifications contained in the Curve Number (CN) Table from the Hydrology Manual (2006) as shown in Table 1. The categories in the land use file corresponded well with the land uses in the VCWPD CN Table with the following exceptions:

1. Vacant undifferentiated land was assumed be open brush in fair condition in rural areas and open space with 50% grass cover in urban areas.
2. Mixed urban land uses were assumed to correspond to commercial properties with 50% effective impervious.
3. Fire stations, public buildings, and schools were assigned to the low industrial use category with an effective impervious value of 36% due to the potential for large landscaped areas.

Soils Information

The soils information was obtained from the District soils shapefile that groups the soil info into categories 1 through 7 corresponding to the NRCS soil categories D through A, respectively. The soils info was clipped to the watershed boundaries using the watershed shapefile. The areas

obtained from the soils files were checked against the total watershed areas to make sure they were identical.

Combined Soils and Land Use Information and Weighted Curve Numbers

The soils and land use shapefiles were then unioned in GIS to obtain the combinations of soil type and land uses in the watersheds. The resulting table was imported into excel and sorted to group the various land uses. The land uses were then assigned a name associated with the data in the District CN Table. Based on the name and soil number, excel functions "match" and "offset" were used to obtain a CN from the CN Table. The weighted soil number and Curve Number for each watershed were calculated using the areas, soil numbers, and CN's. The weighted soil types were checked against the data in the original watershed soil files and were found to be the same. The weighted Curve Numbers were linked to a summary worksheet to be used to calculate the yields by the Water Quality Section. This procedure was also applied to the 7 additional watersheds added to the study in August 2010.

The results are shown in Table 2.

Table 2: Storm Yield Results- Weighted Average Curve Numbers

Between the first request and present, the Hydrology Section has updated their Curve Number tables to make them more consistent with reported infiltration rates in the Hydrology Manual. The resultant CNs were used in the study to see the effect on the yields as shown in Table 3.

Table 3: Storm Yield Results- Weighted Average Curve Numbers with Updated CNs

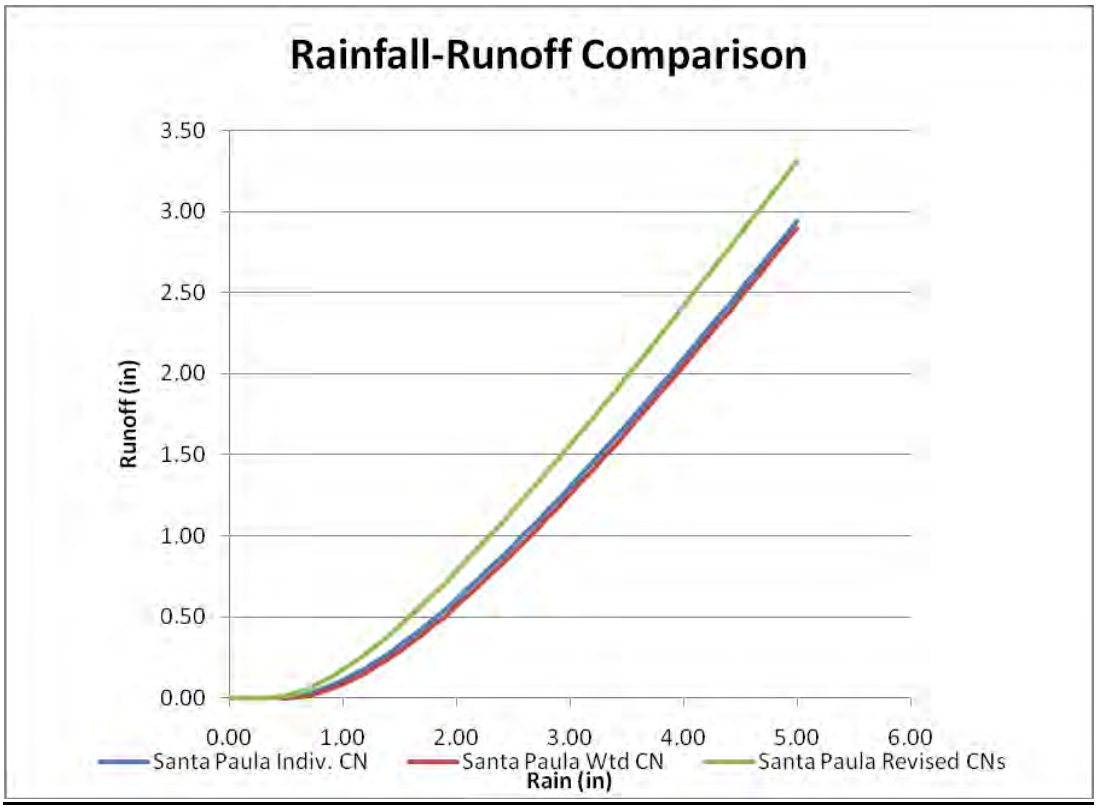
Thousand Oaks	5,179	81.27	5.00	2.30	0.46	3.01	60%

The results showed that the revised CNs provided yields that were 1 or 2% higher than the 2006 CN set except for the Santa Paula watershed. This watershed was soil type 6, which had CNs that were more affected by the updates than most of the CNs for the other soils.

While working on the 2nd request, it was realized that the Hydrology Section could provide more precise estimates of flow at lower rainfall levels by analyzing each soil/land use combination individually and summing the results rather than using a weighted average CN in the runoff equation. So the individual CN results were calculated and summed for both the 7 sites in this update and the previous 4 sites. The resultant spreadsheets provide tables of runoff vs rainfall data. Figure 1 shows a comparison of the rainfall and runoff from a highly developed watershed Camarillo using the weighted average CN, individual CNs, and revised individual CNs.

Figure 1



Conclusions and Limitations

The provided weighted CNs can be used to estimate runoff from low to moderately saturated watersheds. It has been our experience that it is necessary to use Antecedent Moisture Condition III CNs for highly saturated watersheds which only occurs after many days of heavy rainfall such as January 10, 2005. The provided CNs probably will overpredict the runoff coming from the first storms of the season due to the very dry antecedent moisture conditions present then. If necessary further work can be done to provide CNs representing AMC I conditions. Also, the CNs assigned to the various land uses can be calibrated after enough storms have occurred to evaluate the predictive accuracy of the current yield equations provided to the NPDES group. It should also be possible to provide forecasts of runoff from the HSPF forecast model of the Ventura River watershed that more accurate reflect saturated/unsaturated conditions.

❖ Grab and composite samples to Weck Laboratories, Inc. by Weck-provided courier (RMS) from Saticoy Operations Yard:

10/06/10 @ 15:30 PDT (to Amir Levy): All grab samples and composites from OJA/MEI(&MD-1)/VEN/OXN by Kelly Hahs and Tommy Liddell

❖ Remaining composite samples to Weck Laboratories, Inc. by Weck-provided courier (RMS) from Saticoy Operations Yard:

10/07/10 @ 15:05 PDT (to Brandon Ramirez):
CC/SCR/CAM/HUE/VR2/FIL/SPA/MPK/SIM/THO by Kelly Hahs and Bill Carey.

Program Notes

The settings “countdown continues while disabled” and “max run time of 24 hours” combine to end the program 24 hours after initially run, rather than 24 hours after the sampler is enabled and the first sample taken. All samplers will be reprogrammed to maintain the 24 hours max run time, but the countdown setting will be changed to “countdown is stopped while disabled.”

DO(mg/L) = 8.02	Specific Conductance = 1034 uS	

❖ **02/16/11 @ 5:36 a.m. PST (storm control)**

Phone conversation with KH revealed that pacing on 6712 was correct (30,000 cf), but that samples were still being taken about every 2 minutes (at 50 cf = 6,000cf). While attempting to connect to ME-VR2 to determine source of pacing error, power to HOA completely shut down for about 5 minutes. Later unable to connect to site (unable to determine modules, error code 3218). Will have KH multiply pulse counts by 5 (150,000) to get correct pacing of 30,000.

❖ **02/16/11 @ 5:50 a.m. PST (storm control)**

At suggestion of WBC, reset both pacing and enabling, and had KH reset program (pulses set at 150). First 3 samples appear to be accurately spaced, but now flow rate is not being pushed to SQL server. This is a minor issue because data exists and can be back-calculated, but will work on this remotely as time allows this morning.

❖ Grab and composite samples to Weck Laboratories, Inc. by Weck-provided courier (Corporate) from Saticoy Operations Yard:

2/17/11 @ 14:15 PST (to Jorge Nuila): All grab samples and composites from CC/CAM/SPA/FIL/SIM/MPK/THO by Kelly Hahs & Tommy Liddell

❖ Remaining composite samples to Weck Laboratories, Inc. by Weck-provided courier (RMS) from Saticoy Operations Yard:

2/17/11 @ 14:50 PST (to Amir Levy): SCR/HUE/VR2/MEI/OJA/VEN/OXN by Kelly Hahs

Program Notes

From past events: The settings "countdown continues while disabled" and "max run time of 24 hours" combine to end the program 24 hours after initially run, rather than 24 hours after the sampler is enabled and the first sample taken. All samplers will be reprogrammed to maintain the 24 hours max run time, but the countdown setting will be changed to "countdown is stopped while disabled."
