Appendix C. NRCS Curve Number Methodology Discussion

Ventura County Watershed Protection District

Planning & Regulatory Hydrology Section

MEMORANDUM

DATE: September 4, 2009 Updated August 12, 2010

TO: Tommy Liddell

VIA: Bruce Rindahl

FROM: Mark Bandurraga

SUBJECT: NPDES Monitoring Site Yield Evaluation

Per your request, we have used the land use and watershed information you provided to prepare a spreadsheet that can be used to estimate the runoff quantities from storm forecasts. The runoff quantity is estimated using the NRCS Curve Number approach that is a common method in hydrology. The results show that the weighed Curve Numbers estimated from the evaluation range from a low of about 74 for the rural Fox Canyon Drain watershed in Ojai to a high of about 91 for the urbanized watershed in the City of Ventura. The methodology and files used to calculate the Curve Numbers are described in this memo for the watersheds shown in Figures 1-4.

In August 2010 you requested results for another 7 monitoring sites across the county. This memo describes the additional work done for that request.

Curve Number Calculation Methodology

Land Use Data

Land Use data used in the study were provided by the Water Quality Section already clipped to the monitoring site boundaries and in a geodatabase. The land use data were extracted from the Assessor's Parcel database which is considered to be current as of the date of extraction (Feb 12, 2009). The various classifications in the file based on the assessor's 4-digit site use codes were sorted and assigned hydrologic land use names associated with the various classifications contained in the Curve Number (CN) Table from the Hydrology Manual (2006) as shown in Table 1. The categories in the land use file corresponded well with the land uses in the VCWPD CN Table with the following exceptions:

1. Vacant undifferentiated land was assumed be open brush in fair condition in rural areas and open space with 50% grass cover in urban areas.
2. Mixed urban land uses were assumed to correspond to commercial properties with 50% effective impervious.
3. Fire stations, public buildings, and schools were assigned to the low industrial use category with an effective impervious value of 36% due to the potential for large landscaped areas.

Soils Information

The soils information was obtained from the District soils shapefile that groups the soil info into categories 1 through 7 corresponding to the NRCS soil categories D through A, respectively. The soils info was clipped to the watershed boundaries using the watershed shapefile. The areas

obtained from the soils files were checked against the total watershed areas to make sure they were identical.

Combined Soils and Land Use Information and Weighted Curve Numbers

The soils and land use shapefiles were then unioned in GIS to obtain the combinations of soil type and land uses in the watersheds. The resulting table was imported into excel and sorted to group the various land uses. The land uses were then assigned a name associated with the data in the District CN Table. Based on the name and soil number, excel functions “match” and “offset” were used to obtain a CN from the CN Table. The weighted soil number and Curve Number for each watershed were calculated using the areas, soil numbers, and CN’s. The weighted soil types were checked against the data in the original watershed soil files and were found to be the same. The weighted Curve Numbers were linked to a summary worksheet to be used to calculate the yields by the Water Quality Section. This procedure was also applied to the 7 additional watersheds added to the study in August 2010.

The results are shown in Table 2.

Between the first request and present, the Hydrology Section has updated their Curve Number tables to make them more consistent with reported infiltration rates in the Hydrology Manual. The resultant CNs were used in the study to see the effect on the yields as shown in Table 3.

The results showed that the revised CNs provided yields that were 1 or 2% higher than the 2006 CN set except for the Santa Paula watershed. This watershed was soil type 6, which had CNs that were more affected by the updates than most of the CNs for the other soils.

While working on the 2nd request, it was realized that the Hydrology Section could provide more precise estimates of flow at lower rainfall levels by analyzing each soil/land use combination individually and summing the results rather than using a weighted average CN in the runoff equation. So the individual CN results were calculated and summed for both the 7 sites in this update and the previous 4 sites. The resultant spreadsheets provide tables of runoff vs rainfall data. Figure 1 shows a comparison of the rainfall and runoff from a highly developed watershed Camarillo using the weighted average CN, individual CNs, and revised individual CNs.

Figure 1

Conclusions and Limitations

The provided weighted CNs can be used to estimate runoff from low to moderately saturated watersheds. It has been our experience that it is necessary to use Antecedent Moisture Condition III CNs for highly saturated watersheds which only occurs after many days of heavy rainfall such as January 10, 2005. The provided CNs probably will overpredict the runoff coming from the first storms of the season due to the very dry antecedent moisture conditions present then. If necessary further work can be done to provide CNs representing AMC I conditions. Also, the CNs assigned to the various land uses can be calibrated after enough storms have occurred to evaluate the predictive accuracy of the current yield equations provided to the NPDES group. It should also be possible to provide forecasts of runoff from the HSPF forecast model of the Ventura River watershed that more accurately reflect saturated/unsaturated conditions.

❖ Follow Up

VCWPD Staff contacted the Nature Conservancy's Land Manager after the event. The Land Manager had spoken to one of the two trespassers on the 31st and told him they had to move. They said they would but didn't. The two have been a recurring problem for The Nature Conservancy at that site. They have been asked to move, which they sometimes do, they have also been arrested, but they still come back.

The Land Manager will have them removed in the future and also provided VCWPD staff with contact numbers for the local Sheriff's deputies, in case of future non-business hour problems or emergencies. The Land Manager will continue to be the primary contact for non-emergency business hour incidents.

NPDES 2014/15 Water Quality Monitoring Event #2 (Wet), December 2-3, 2014 Summary

Notes: The Ventura River and Santa Clara River watersheds were sampled. Most of the Calleguas Creek watershed received over 0.1" rainfall (much greater than forecast) on 11/30/2014 so was excluded from this sample event due to the Permit requirement of 7 days of <0.1" rainfall prior to an event. Weather forecasts produced on the 1st showed rain beginning mid-morning on the 2nd with 1" to 2" in all areas. On the 2nd, forecasts were higher at 2" to 4" in all areas. Sites were reprogrammed for the higher amounts, which did not occur and therefore sample volume was limited at some sites.

NPDES 2014/15 Water Quality Monitoring Event #4 (Wet), April 7-8, 2015 Summary

Notes: Two major outfall sites in the Ventura River watershed were successfully sampled. Part of the sampling line at ME-VR2 became disconnected, so composite samples could not be collected, however the site also did not see the 20% flow increase required by the Permit. The Santa Clara River and Calleguas Creek watersheds were set up for sampling but did not receive qualifying rainfall with the exception of ME-SCR, so they were excluded from this event, however some bacteria samples were collected and analyzed. These samples will be entered into the database under the event name 2014/15-4 with the EventType of Non-Qualifying (for non-qualifying) and will be flagged in the comments with the rainfall amount. Part of the intake line at ME-SCR was kinked resulting in no composite sample for that site.

NPDES 2014/15 Water Quality Monitoring Event #5 (Wet), May 15, 2015 Summary

Notes: Wednesday morning forecasts around 0.50", dropped to around 0.25" by the afternoon. Rain started on Thursday, but the event was very showery and unpredictable for grab sample collection. By Friday morning, front was offshore and being kept there by east winds so the larger second band of rain seen in the forecasts did not make it to Ventura County. Teams pulled composite bottles that filled during Thursday evening's showers but only collected grabs at the mass emission stations. OJA and MEI omitted from this event (permit wet requirements complete). HUE did not get enough rain to trigger. OXN and VEN were collected but analysis was canceled due to disqualifying rainfall amounts (0.07"). MPK qualified but collected only a couple of liters of sample.

Sampling Durations (to nearest 0.5 hours):

ME-CC = 9.0 hrs.	ME-SCR = 8.5 hrs.	ME-VR2 = 8.5 hrs.
